

## Client case study:

**The London Design & Build Company** – Holland Park, London W11

Situated on this highly sought-after area in fashionable Holland Park, an 18th century period villa has been refurbished into luxurious apartments by The London Design & Build Company to the highest standards. We were chosen again by the project team to install security systems to meet those high standards.

## The challenge

- An intruder alarm was required for the property which comprised of two floors
- 24hr monitoring was required for the intruder alarm due to insurance requirements
- Fire alarm 24hr monitoring was also required by both the client and local authorities due to the historic nature of the building
- Additional smoke detectors were required during the 2nd phase of construction works

## Our solution

Ryder Security Systems installed an intruder alarm and smoke detection devices which provided the required protection over both floors. Additional alarm keypads were also installed so the client can arm different parts of the system ( usually at night) whilst still in the apartment.

The additional smoke detectors were integrated with the intruder alarm which reduced the need for extra cabling and alongside the 24hr monitoring communications, which was also via the intruder alarm, provided a cost effective solution whilst still meeting all the requirements including the peace of mind 24hr monitoring and fire brigade response.
